IN THE CLAIMS:

Please amend Claims 1 and 9 as shown below. Please cancel Claim 6 without prejudice or disclaimer of subject matter. The claims, as currently pending in the application, read as follows:

1. (Currently Amended) An electrical device comprising a conductor in which a plurality of plate portions are connected to each other at portions thereof, wherein at least two plate portions are formed into coils by winding said plate portions around a winding core, ~~and~~ said plate portions to be connected to each other are arranged point-symmetrically about a connecting portion thereof, said conductor has plural terminals in positions that protrude from an area of said plate portions that is wound around the winding core, and said conductor except for the plural terminals is insulated by an insulating material layer.

2. (Previously Presented) The device according to claim 1, wherein the connecting portion of said plate portions is utilized as a tap of said coils.

3. (Previously Presented) The device according to claim 1, wherein the connecting portion of said plate portions is utilized as a center tap of a transformer.

4. (Cancelled).

5. (Original) The device according to claim 1, wherein each of said plate portions has a laminated structure of a conductor and insulator.

6. (Cancelled).

7. (Original) The device according to claim 1, wherein each of said plate portions has at least one electrode at a position thereof corresponding to a vicinity of a center of said coils.

8. (Original) The device according to claim 1, wherein each of said plate portions has at least one electrode at a position thereof corresponding to an end of a corresponding one of said coils and a vicinity of a center of said coils.

9. (Currently Amended) A method of producing an electrical device, said method comprising steps of:

forming a conductor in which a plurality of plate portions are connected to each other at portions thereof, wherein the conductor has plural terminals;

covering the conductor except for the plural terminals with an insulating material; and

forming at least two plate portions of the conductor into coils by winding the plate portions around a winding core such that the plural terminals protrude from an area of the plate portions that is wound around the winding core, wherein the plate portions to be connected to each other are arranged point-symmetrically about a connecting portion thereof.
